

ABSTRACT

A mop device includes a support element attached to bottom of a handle, and an abrasive surface member detachably attached to the support element. The abrasive surface member includes a resilient
5 element and a lower cover member secured together, to form one or more swellings and one or more depressions in the abrasive surface member, and to effectively engage with and mop the ground or surfaces to be cleaned. The abrasive surface member includes an upper cover sheet secured onto the resilient element with one or
10 more coupling elements, and one or more coupling devices attached to the cover sheet for securing to the support element.
